                                                                                                                      THE ENZYME (BY SIMILARITY).

ENZYME REGULATION: REGULATED BY CALCIUM/CALMODULIN (IN CONTRAST WITH MOUSE). ASPIRIN INHIBITS EXPRESSION AND FUNCTION OF THIS ENZYME AND EFFECTS MAY BE EXERTED AT THE LEVEL OF TRANSLATIONAL/POSTTRANSLATIONAL MODIFICATION AND DIRECTLY ON THE CATALYTIC ACTIVITY (BY SIMILARITY).

SUBUNIT: HOMODIMER.

TISSUE SPECIFICITY: EXPRESSED IN THE LIVER, RETINA, BONE CELLS AND AIRMAY EPITHELIAL CELLS OF THE LING, NOT EXPRESSED IN THE
WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. IN MACROPHAGES, NO MEDIATES TUMORICIDAL AND BACTERICIDAL ACTIONS.

CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) ~ CITRULLINE + NITE COXIDE + N NADPH + N NADPH + M O(2) ~ CITRULLINE + COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oxidoreductase; NADP; FAD; FMN; Calcium-binding; Calmodulin-binding; Heme; Phosphorylation; Zinc; Metal-binding; Multigene family;

-I FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. IN MARCHPHAGES, NO MEDIATES TUMORICIDAL ADD BACTERICIDAL ACTIONS. MAY BE INVOLVED IN THE PATHOGENESIS OF DILATED CARDIOMYOPATHY OR OF EXERCISE INVOLERANCE OBSERVED IN PATIENTS WITH CHRONIC HEART FAILURE.

-I CATALYTIC ACTIVITY: L-AGGININE + N NADPH + M O(2) ·· CITRULLINE + NITRIC OXIDE + N NADPH + M O(2) ·· CITRULLINE + NITRIC OXIDE + N NADPH +).

-I COPPACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FWN. ALSO REQUIRES THE REVAMENCE OF SIMILARITY.

-I ENZYME (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NS2D_HUMAN STANDARD; PRT; 1147 AA.

"Rabbit iducible nitric oxide synthase gene-NOS II.";

Submitted (JAN-1997) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE
WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY.

-!- CAPALVITC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE +

NITRIC OXIDE + N NADP(+).

-!- COPEACYOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES

TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF

"Crystal structure of constitutive endothelial nitric oxide synthase:

"Crystal structure of constitutive endothelial nitric oxide synthase:

a paradigm for pterin function involving a novel metal center.";

Call 95:939-950(1998).

-!- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS IMPLICATED IN VASCULAR SMOOTH MUSCLE RELAXATION THROUGH A CGMP-MEDIATED SIGNAL TRANSDUCTION PATHMAY. NO MEDIATES VASCULAR ENDOTHELIAL GROWTH FACTOR (VEGF) INDUCED ANGIOGENESIS IN CORONARY VESSELS AND PROMOTES BLOOD CLOTTING THROUGH THE ACTIVATION OF PLATELETS.

-!- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) - CITRULLINE + NITRIC OXIDE + N NADP(+).

-!- COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FWN. ALSO REQUIRES.

The nucleotide and deduced amino acid sequences of the encephalomyocarditis viral polyprotein coding region.";
Nuclet Acids Res. 12:2969-2985(1984).
1- FUNCTION: P3C POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTAIN O/G SITES IN THE POLYPROTEIN. IT MAY BE A CYSTEINE PROTEASE.
1- SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL UNITS, EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VP2, VP3, AND VP4.
1- PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polyprotein; Coat protein; Core protein; Transferase;

Virology 170:280-287(1989).

-!- FUNCTION: PAC POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTAIN Q/G SITES IN THE POLYPROTEIN. IT MAY BE A CYSTEINE PROTEASE.

-!- SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL UNITS, EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VP2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -1- PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A.Gene: NOS
C.Function:
Description: catalyzes the oxidation of an L-arginine guanidino nitrogen and of NAD
C.Superfamily: nitric-oxide synthase; flavodoxin homology; NADPH--ferrihemoprotein re
C.Keywords: calmodulin binding; chromoprotein; FAD; flavoprotein; FMN; heme; iron; me
F;533-1121/Domain: NADPH--ferrihemoprotein reductase homology <FEH>
F;535-671/Domain: flavodoxin homology <FLX>
F;194/Binding site: heme iron (Cys) (axial ligand) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Residues: 1-71, Y',73-347,'PV',350-678,'VP',681-720,'L',722-739,'L',741-843,'G',845

Probable phosphoesterase (EC 3.1.-.-) yhcR - Bacillus subtilis

N;Alternate names: 5'-nucleotidase homolog yhcR
C;Species: Bacillus subtilis
C;Species: Bacillet, S.; Bruschi, C.V.; Caldwell, B.; Capuano, V.; Garter, N.M.;
R;Kunst, F.; Ogasawara, N.; Moszer, I.; Albertini, A.M.; Alloni, G.; Azevedo, V.; Berr

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                   This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriaais, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (inOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple scherosis. This sequence represents a peptide fragment from human iNOS which is used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the

The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protection of mammalian cells against immunotoxicity or lipotoxicity - used for treating, e.g. diabetes, obesity, wasting syndromes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Manganese containing superoxide dismutase; MnSOD; IDDM; diabetes mellitus; treatment; therapy; nitric oxide; NO; beta cell; fatty acid; lipotoxic; cytotoxic; cytokine; osteoporosis; inflammatory disease; autoimmune disease; neurodegenerative disease.
                                                                                        Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human INOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Koyama K, Lee Y, Newgard CB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                              This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis; Mab.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection;

                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                    achieved by blocking free radical production or the accumulation of free radicals in that cell. Treatment of insulin dependent diabetes mellitus (IDDM) can be achieved by by blocking nitric oxide (NO) production in a pancreatic beta cell and by providing a composition comprising an agent that reduces levels of fatty acids in the cells and protects beta-cells of the subject against lipid-mediated cell ceath. Cells can also be protected against lipid-mediated cell ceath. Cells can also be protected against intric oxide mediated cells cytocoxicity by introducing into the cells an antioxidising agent. The methods can be used for protecting cells against immunotoxicity mediated by, e. g. ll-1 beta, ll-1 alpha, gamma IFN, TNF alpha, TL-2, ll-6, ll-2, ll-3, ll-5, ll-7, ll-9, ll-1, l
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAQ66914 is from human hepatocyte inducible nitric oxide synthase clone pHINOS from lambda Zap II cDNA library. The original source was induced human hepatocyte RNA. HINOS cDNA plasmid is pref.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence encoded by the cDNA clone for human hepatocyte inducible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cDNA clone encoding human inducible nitric oxide synthase - used to prevent the hypotensive shock seen with sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

transformed in E. coli SOLR (ATCC 69126). The inventors claim a clone with the cDNA sequence in AAQ66914 and a cDNA clone which encodes AAR55764. The cloning and expression of a human tissue nitric oxide synthase cDNA provides a source of the enzyme for therapeutic purposes, for example to prevent the hypotensive shock seen with sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nitric-oxide-synthase. cDNA was generated and used to construct a library in lambda ZAPII. This was screened with a 650 bp fragment of mouse inducible NO-synthase cDNA to identify the full-length clone PBSHSINOS. The insert was transferred to pSVL to give a vector capable of expressing NO-synthase in CHO cells under control of a

                                                                                                                                                                                                                                                                                                                                        An inducible nitric oxide syntase (iNOS - AAR88464) is the product of a CDNA clone (AAT10115) derived from human hepatocytes induced for iNOS blosynthesis. The iNOS can be obtd. by expression of the CDNA e.g. in mammalian host cells and is used in the development of selective inhibitors of NOS or to treat diseases affected by nitric oxide.

This protein comprises human penis inducible nitric oxide synthetase (HPINOS). Its amino acid sequence was deduced from a con Aribania cancel mean human penile smooth muscle cell mRNA. The invention is directed to a method of treating erectile dysfunction in a patient by providing an agent capable of treating erectile dysfunction, and introducing an effective amount of the agent into the penile tissue of the patient. Preferably, the agent into the penile tissue of the patient. Preferably, the agent induces cavernosal smooth muscle relaxation, and/or produces an increase in the level of NOS in tissue. Preferably, the NOS is NOS, and the agent is introduced into the corpora cavernosa of the penis. The agent is preferably an NOS inducer, an NOS protein such as HPINOS, a cDNA encoding an NOS such as HPINOS, or cDNA transformed penile cells, especially corpora cavernosa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Amino acid sequence of a human inducible nitric oxide synthase (NOS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gene therapy, angiogenesis; nucleic acid delivery; arteriosclerosis; nitric oxide synthase; NOS; endothelial dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                Treatment of erectile dysfunction - by introducing an agent into penile tissue, particularly for inducing cavernosal smooth muscle relaxation or increasing NOS levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .;

                                                                                   Nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase, used for isolated tissue perfusion treatment to enhance
                                                                                                                                               The specification describes a method for gene therapy for enhancing and inducting angiogenesis. The method uses a nucleic acid delivery vehicle, which comprises a nucleic acid encoding nitric oxide synthase (NOS). The delivery vehicle is used for the manufacture of a pharmaceutical composition for isolated tissue perfusion treatment. The method is useful for enhancing and/or inducing angiogenesis in patients with endothelial dysfunctions, in particular arteriosclerosis. The present sequence represents an inducible NOS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of a nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase, especially useful in gene therapy for enhancing and/or inducing angiogenesis and treating atherosclerosis \cdot

specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.
